IIT / NPTEL • 2025

PROFESSIONAL SUMMARY

Driven 2nd-year AI & Data Science student seeking an internship in Data Science or Machine Learning Research. Possesses hands-on experience in Python-based development, exploratory data analysis, IoT-integrated systems, and cross-platform tooling. Eager to leverage technical expertise to optimize real-world ML pipelines, uncover actionable data insights, and solve complex problems.

EDUCATION

- B.Tech in Artificial Intelligence & Data Science**2024 – 2028
- SRM Madurai College of Engineering and Technology*
- Current Status: 2nd Year, 4th Semester.
 - Focused on foundational AI principles, advanced data structures, and practical machine learning applications.

TECHNICAL PROJECTS

Steam Games EDA Pipeline2025

Data Analysis & Visualization [github.com/aaditya079/steam-eda](#)

- Engineered a comprehensive data analysis pipeline to process and clean a dataset of 114,000+ Steam games, analyzing trends across genres, pricing models, and user ratings.
- Uncovered critical market insights, including a near-zero correlation (0.015) between game price and user ratings, statistically proving higher prices don't guarantee better reception.
- Designed 5 high-quality visualizations illustrating genre distributions (Indie as leading genre) and identifying psychological pricing clusters.

Python

Pandas

Seaborn

Matplotlib

ImgSeek2025

OCR & Desktop Tooling [github.com/aaditya079/ImgSeek](#)

- Built a Windows desktop tool that runs bulk OCR across entire image folders using the native Windows.Media.Ocr engine — zero API keys or internet dependency.
- Engineered a recursive image scanner supporting PNG, JPG, JPEG, WEBP, and BMP, auto-generating a searchable HTML gallery with click-to-enlarge lightbox for matched results.
- Implemented a zero-cost local OCR pipeline capable of scanning thousands of screenshots to locate any name or keyword, demonstrating practical NLP-adjacent text extraction skills.

C#

.NET 6

Windows OCR

HTML

GitSynth2025

Web Application [github.com/aaditya079/gitsynth](#)

- Architected a fully client-side, zero-dependency GitHub Profile README builder with real-time reactive rendering — no frameworks, no build tools, pure Vanilla JS.
- Designed a dynamic tech badge catalog system allowing users to select from curated shields.io badges, with instant markdown preview updates.
- Deployed on GitHub Pages with one-click copy-to-clipboard and direct README.md download — immediately usable with zero local setup.

Automated Room Occupancy Detector2025

Embedded Systems & IoT

- Developed and deployed an IoT-based room occupancy detection system utilizing PIR motion sensors to track real-time physical presence accurately.
- Programmed control logic loops to process hardware sensor inputs and automate environment state responses.
- Established a foundational architecture for sensor-driven AI applications by successfully interfacing hardware with software control loops.

Arduino

PIR Sensors

IoT

Python

KEY ACHIEVEMENTS

- 3rd Place — Bug Busters Coding Competition**2025
- Dr. N.G.P. Institute of Technology, Coimbatore*
- Secured 3rd place out of numerous regional participants in a highly competitive programming and algorithmic event.
 - Collaborated effectively in a 2-member team to solve custom, complex coding problem sets under strict time constraints.
